

Laboratory Criteria for confirmation of the Disease - L form (2019)

1.	Measles	A presumptive case with <ul style="list-style-type: none">• Detection of anti-measles IgM antibody by enzyme immunoassay (EIA) <p style="text-align: center;">OR</p> <ul style="list-style-type: none">• Measles virus detection through PCR from throat swab or urine or nasopharyngeal swab <p style="text-align: center;">OR</p> <ul style="list-style-type: none">• Direct epidemiologic linkages to a case confirmed by one of the above methods <p>SOURCE: Immunisation Division shared on 28.05.2019</p>
2.	Diphtheria	A presumptive case with <ul style="list-style-type: none">• Isolation of <i>Corynebacterium diphtheriae</i> <p style="text-align: center;">OR</p> <ul style="list-style-type: none">• Detection by PCR from a clinical specimen. <p>SOURCE: Immunisation Division shared on 28.05.2019</p>
3.	Pertussis	A presumptive case with <ul style="list-style-type: none">• Isolation of <i>B. pertussis</i> from a clinical specimen <p style="text-align: center;">OR</p> <ul style="list-style-type: none">• Single serum positive for IgG antibody <p style="text-align: center;">OR</p> <ul style="list-style-type: none">• PCR positive for pertussis <p>SOURCE: Immunisation Division shared on 28.05.2019</p>
4.	Polio	An AFP case is ‘confirmed’ as polio only by the <ul style="list-style-type: none">• isolation of wild poliovirus from any stool specimen in WHO accredited laboratory <p>SOURCE: Immunisation Division shared on 28.05.2019</p>

5.	Rubella	<p>Rubella infection is confirmed by any one of the following laboratory tests</p> <ul style="list-style-type: none"> • Positive serologic test for rubella IgM antibody <p style="text-align: center;">OR</p> <ul style="list-style-type: none"> • Detection of rubella-virus specific nucleic acid by polymerase chain reaction; <p style="text-align: center;">OR</p> <ul style="list-style-type: none"> • Isolation of rubella virus <p>SOURCE: Immunisation Division shared on 28.05.2019</p>
6.	Human Rabies	<p>A presumptive case or death is confirmed by</p> <ul style="list-style-type: none"> • Detection by FAT on skin biopsy (ante mortem) <p style="text-align: center;">OR</p> <ul style="list-style-type: none"> • Detection of rabies viral antigens by direct fluorescent antibody test (FAT) or by ELISA in clinical specimens, preferably brain tissue (collected post mortem) <p style="text-align: center;">OR</p> <ul style="list-style-type: none"> • FAT positive after inoculation of brain tissue, saliva or CSF in cell culture, or after intracerebral inoculation in mice or in suckling mice <p style="text-align: center;">OR</p> <ul style="list-style-type: none"> • Detectable rabies-neutralizing antibody titre in the serum or the CSF of an unvaccinated person <p style="text-align: center;">OR</p> <ul style="list-style-type: none"> • Detection of viral nucleic acids by PCR on tissue collected post mortem or intra vitam in a clinical specimen (brain tissue or skin, cornea, urine or saliva). <p>SOURCE: National Rabies Control Programme shared on 12.06.2019</p>

7.	Leptospirosis	<p>A presumptive case with</p> <ul style="list-style-type: none"> • IgM ELISA positive <p style="text-align: center;">OR</p> <ul style="list-style-type: none"> • Isolation of leptospire from clinical specimen <p style="text-align: center;">OR</p> <ul style="list-style-type: none"> • Four fold or greater rise in the MAT titer between acute and convalescent phase serum specimens run in parallel <p style="text-align: center;">OR</p> <ul style="list-style-type: none"> • PCR test. <p>SOURCE: Programme for prevention and control of Leptospirosis shared on 12.06.2019</p>
8.	Hepatitis-A	<p>A presumptive case with</p> <ul style="list-style-type: none"> • IgM antibodies to hepatitis A(anti HAV IgM) in serum/plasma <p style="text-align: center;"><i>Note: The sample has to be tested as per testing algorithm for jaundiced patient according to guidelines of National Viral Hepatitis Control Programme</i></p> <p>SOURCE: National Viral Hepatitis Control Programme shared on 10.06.2019</p>
9.	Hepatitis-E	<p>A presumptive case with</p> <ul style="list-style-type: none"> • IgM antibody to hepatitis E virus (anti HEV IgM) in serum/plasma <p style="text-align: center;"><i>Note: The sample has to be tested as per testing algorithm for jaundiced patient according to guidelines of National Viral Hepatitis Control Programme</i></p> <p>SOURCE: National Viral Hepatitis Control Programme shared on 10.06.2019</p>

<p>10.</p>	<p>Dengue/DHF</p>	<p>A presumptive case with</p> <ul style="list-style-type: none"> • Demonstration of dengue virus antigen in serum sample by NS1-ELISA. <p>OR</p> <ul style="list-style-type: none"> • Demonstration of IgM antibody titre by ELISA in single serum sample. <p>OR</p> <ul style="list-style-type: none"> • IgG seroconversion in paired sera after 2 weeks with four fold increase of IgG titres. <p>OR</p> <ul style="list-style-type: none"> • Detection of viral nucleic acid by polymerase chain reaction (PCR). <p>OR</p> <ul style="list-style-type: none"> • Isolation of the virus (Virus culture positive) from serum, plasma or leucocytes. <p>SOURCE: NVBDCP shared on 11.06.2019</p>
<p>11.</p>	<p>Chikungunya</p>	<p>A presumptive case with</p> <ul style="list-style-type: none"> • MAC ELISA- Presence of virus specific IgM antibodies in a single serum sample collected in acute or convalescent stage. Four-fold increase in IgG values in samples collected at least three weeks apart. <p>OR</p> <ul style="list-style-type: none"> • Virus isolation <p>OR</p> <ul style="list-style-type: none"> • Presence of viral RNA by RT-PCR <p>SOURCE: NVBDCP shared on 11.06.2019</p>

12.	Japanese Encephalitis	<p>A Presumptive case with</p> <ul style="list-style-type: none"> • Presence of IgM antibody in serum and/or CSF <p>OR</p> <ul style="list-style-type: none"> • Four fold difference in IgG antibody titre in paired sera <p>OR</p> <ul style="list-style-type: none"> • Virus isolation from brain tissue <p>OR</p> <ul style="list-style-type: none"> • Antigen detection by immunofluorescence Nuclie acid detection by PCR <p>SOURCE: Guidelines for surveillance of Acute Encephalitis Syndrome shared on 25.06.2019</p>
13.	Malaria	<p>A suspected case with</p> <ul style="list-style-type: none"> • Positive malaria parasite in peripheral blood smear detected through microscopy <p>OR</p> <ul style="list-style-type: none"> • Positive antigen based detecting Rapid Diagnostic Test (RDTs) <p>OR</p> <ul style="list-style-type: none"> • Positive molecular diagnostic test. <p>Note: On rare occasions, the presence of occult malaria infection in a blood or organ donor, confirmed retrospectively, by the demonstration of malaria parasites in the recipient of the blood or organ.</p> <p>Source: NVBDCP shared on 09.07.2019</p>
14.	Kala Azar	<p>A 'suspect' Kala azar patient found positive on screening with rapid diagnostic test.</p> <p>OR</p> <p>In cases with past history of Kala-azar or in those with high suspicion of kala azar with negative RDT test result but found positive by bone marrow/spleen aspirate for LD bodies.</p> <p>Source: NVBDCP shared on 09.07.2019</p>

15.	Cholera	<p>An presumptive Acute Diarrheal case with</p> <ul style="list-style-type: none"> • Culture <p style="text-align: center;">OR</p> <ul style="list-style-type: none"> • Polymerase chain reaction (PCR) test <p>SOURCE: WHO–recommended standards for surveillance of selected Vaccine-preventable diseases, 2018 (modified on 28.05.2019)</p>
16.	Shigellosis	<p>An acute diarrhoea/dysentery case with</p> <ul style="list-style-type: none"> • isolation of Shilgella species from stool sample <p>SOURCE: Public Health Laboratory Network case definitions, May 2000 (modified on 28.05.2019)</p>
17.	Typhoid	<p>A presumptive case with</p> <ul style="list-style-type: none"> • Confirmed positive culture (blood, bone marrow, stool, urine) <p style="text-align: center;">OR</p> <ul style="list-style-type: none"> • Molecular methods of S. typhi/ S paratyphi. <p>SOURCE: WHO–recommended standards for surveillance of selected Vaccine-preventable diseases,2018 (modified on 28.05.2019, NCDC)</p>

18.	Mumps	<p>A presumptive case with</p> <ul style="list-style-type: none"> • Isolation of mumps virus by culture or reverse transcription-polymerase chain reaction (RT-PCR) from an appropriate clinical specimen (buccal/oral swab, throat swab, urine, and cerebrospinal fluid) <p>OR</p> <ul style="list-style-type: none"> • Seroconversion from IgG negative to IgG positive as determined by any standard serological assay in the absence of mumps immunization in the preceding six weeks <p>OR</p> <ul style="list-style-type: none"> • In unvaccinated individuals, significant (\geq fourfold) rise in serum mumps IgG titre as determined by any standard serological assay <p>SOURCE: WHO–recommended standards for surveillance of selected Vaccine-preventable diseases,2018 (modified on 28.05.2019, NCDC)</p>
19.	Chicken pox	<p>A presumptive case with</p> <ul style="list-style-type: none"> • Detection of VZV DNA (using PCR) <p>OR</p> <ul style="list-style-type: none"> • direct antigen detection of VZV from an appropriate clinical specimen e.g. direct fluorescent antibody (DFA) <p>OR</p> <ul style="list-style-type: none"> • isolation using viral culture* <p>OR</p> <ul style="list-style-type: none"> • seroconversion* or a significant rise (fourfold or greater) in varicella-zoster IgG titer between acute and convalescent sera by any validated serologic assay <p>SOURCE: WHO–recommended standards for surveillance of selected Vaccine-preventable diseases, 2018 (modified on 28.05.2019, NCDC)</p>

20.	Influenza	<p>A presumptive case of ILI or SARI with</p> <ul style="list-style-type: none"> • Conventional PCR or real-time reverse transcription PCR (RT-PCR) <p style="text-align: center;">OR</p> <ul style="list-style-type: none"> • Any validated nucleic acid based test. <p>SOURCE: NCDC, Technical Guidelines on H1N1 (revised on 25.02.2019)</p>
21.	Meningococcal Meningitis	<p>A presumptive case with</p> <ul style="list-style-type: none"> • Grams staining and/Or Antigen detection by Latex Agglutination Test in CSF <p style="text-align: center;">OR</p> <ul style="list-style-type: none"> • Isolation of N. meningitidis from blood or CSF <p style="text-align: center;">OR</p> <ul style="list-style-type: none"> • Detection of N. meningitidis-specific nucleic acid in a specimen obtained from a normally sterile body site (e.g., blood or CSF), using a validated polymerase chain reaction (PCR) assay <p>SOURCE: NCDC, CD alert Nov 2009 (modified on 28.05.2019, NCDC)</p>
22.	Yellow Fever	<p>A presumptive case, in the absence of recent yellow fever vaccination,</p> <ul style="list-style-type: none"> • Yellow-fever- specific IgM is found in the serum, <p style="text-align: center;">OR</p> <ul style="list-style-type: none"> • A fourfold or greater rise in IgG levels is found in PAIRED acute and convalescent sera, <p style="text-align: center;">OR</p> <ul style="list-style-type: none"> • Yellow fever virus is isolated in cell culture or laboratory animals, or in case of positive post-mortem liver histopathology, <p style="text-align: center;">OR</p> <ul style="list-style-type: none"> • Yellow fever antigens are detected in tissues by immunohistochemistry <p style="text-align: center;">OR</p> <ul style="list-style-type: none"> • Yellow fever virus genomic sequences are detected in blood or organs by molecular diagnostic techniques such as Reverse Transcription Polymerase Chain Reaction (RT- PCR) <p>SOURCE: NCDC updated guidelines on Yellow fever</p>

23.	Nipah Virus Disease	<p>A presumptive case with</p> <ul style="list-style-type: none"> • Nipah virus RNA identified by PCR from respiratory secretions, urine, or cerebrospinal fluid <p style="text-align: center;">OR</p> <ul style="list-style-type: none"> • Isolation of Nipah virus from respiratory secretions, urine or cerebrospinal fluid <p>SOURCE: NCDC updated guidelines on Nipah Virus Disease</p>
24.	Ebola Virus Disease	<p>A presumptive case with</p> <ul style="list-style-type: none"> • Positive IgM antibody <p style="text-align: center;">OR</p> <ul style="list-style-type: none"> • Positive PCR <p style="text-align: center;">OR</p> <ul style="list-style-type: none"> • Viral isolation. <p>SOURCE: NCDC updated guidelines on Ebola Virus Disease</p>
25.	Zika Virus Disease	<p>A presumptive case with</p> <ul style="list-style-type: none"> • laboratory positive result for the specific detection of ZIKV by RT-PCR <p>SOURCE: NCDC, CD alert March 2016 (modified on 28.05.2019, NCDC)</p>
26.	Scrub Typhus	<p>A presumptive case with</p> <ul style="list-style-type: none"> • IgM ELISA is positive for scrub typhus. <p style="text-align: center;">OR</p> <ul style="list-style-type: none"> • O. Tsutsugamushi DNA is detected in eschar samples or whole blood by PCR <p style="text-align: center;">OR</p> <ul style="list-style-type: none"> • Seroconversion or four fold rise or fall in antibody titres in paired sera detected by ELISA or Indirect Immune Fluorescence Assay (IFA) or Indirect Immunoperoxidase Assay (IPA). <p>SOURCE: Updated by Zoonosis Division NCDC on 2.07.2019</p>

27.	Kyasanur Forest Disease	<p>A presumptive case with</p> <ul style="list-style-type: none"> • Detection of KFDV-specific viral RNA by reverse transcription polymerase chain reaction (RT-PCR) or real time RT-PCR from blood or tissues <p style="text-align: center;">OR</p> <ul style="list-style-type: none"> • Positive for immunoglobulin M (IgM) enzyme-linked immunosorbent assay (ELISA) for KFD <p style="text-align: center;">OR</p> <ul style="list-style-type: none"> • Isolation of KFDV in cell culture or in a mouse model, from blood or tissues <p>SOURCE: Updated by Zoonosis Division NCDC on 2.07.2019</p>
28.	Crimean Congo Hemorrhagic Fever (CCHF)	<p>A presumptive case with</p> <ul style="list-style-type: none"> • Detection of CCHF virus genome by validated RT - PCR in a clinical specimen AND/ OR sequencing <p style="text-align: center;">OR</p> <ul style="list-style-type: none"> • Detection by ELISA or IFA of specific IgM antibodies against CCHF virus <p style="text-align: center;">OR</p> <p>A 4-fold increase in specific IgM antibodies against CCHF virus in two specimens collected in the acute and convalescence phases</p> <p style="text-align: center;">OR</p> <ul style="list-style-type: none"> • CCHF virus isolation <p>SOURCE: Updated by Zoonosis Division NCDC on 2.07.2019</p>
29.	Brucellosis	<p>A presumptive case with</p> <ul style="list-style-type: none"> • A titre of 1:160 or more by Standard Agglutination Test (SAT). <ul style="list-style-type: none"> ○ An attempt to demonstrate 4 fold rise in antibody titre should be made. ○ Prozone phenomenon (antibody excess) should be kept in mind. <p style="text-align: center;">OR</p> <ul style="list-style-type: none"> • Positive by IgM / IgG ELISA <p style="text-align: center;">OR</p> <ul style="list-style-type: none"> • Detection of Brucella DNA in clinical sample by PCR. <p style="text-align: center;">OR</p> <ul style="list-style-type: none"> • Isolation of Brucella in clinical sample. <p>SOURCE: Updated by Zoonosis Division NCDC on 2.07.2019</p>

30.	Anthrax	<p>A presumptive case with</p> <ul style="list-style-type: none"> • Isolation and identification of B. anthracis from relevant samples and identified by colony morphology, microscopy and biochemical test. • Gamma phage lysis OR validated PCR (Toxin and capsule genes) may be used for final confirmation (Validated PCR on direct clinical sample is also acceptable). <p>SOURCE: Updated by Zoonosis Division NCDC on 2.07.2019</p>
31.	West Nile Fever	<p>An AES case with</p> <ul style="list-style-type: none"> • Viral detection by reverse transcription polymerase chain reaction (RT-PCR) assay, OR • IgM antibody capture enzyme-linked immunosorbent assay (ELISA); PRNT is recommended to rule out cross reactions and confirmation. OR • Virus isolation by cell culture. <p>SOURCE: Updated by Zoonosis Division NCDC on 2.07.2019</p>
32.	Plague	<p>A presumptive case with</p> <ul style="list-style-type: none"> • An isolate from a clinical sample identified as Y.pestis, and two of the four following tests must be positive: <ul style="list-style-type: none"> • Y.pestis biochemical profile. • Bacteriophage lysis of culture. • F1 Antigen detection • PCR (pla gene, F1 gene) OR • A fourfold difference in anti F1 antibody titre in paired serum samples OR • Direct validated PCR on clinical specimen. <p>SOURCE: Updated by Zoonosis Division NCDC on 2.07.2019</p>

33.	MERS Co-V	<p>A presumptive case with</p> <ul style="list-style-type: none">• The presence of viral nucleic acid can be confirmed by either positive results for nucleic acid amplification assays, such as<ul style="list-style-type: none">○ reverse transcription polymerase chain reaction (RT-PCR), for at least two specific genomic targets <p style="text-align: center;">OR</p> <ul style="list-style-type: none">○ A single positive target with sequencing of a second target. <p style="text-align: center;">OR</p> <ul style="list-style-type: none">• Demonstration of sero-conversion in 2 samples ideally taken at least 14 days apart, by a screening (ELISA, IFA) and a neutralization assay. <p>SOURCE: Updated by Zoonosis Division NCDC on 2.07.2019</p>
